

METHOD OF SCREEN PRINTING SHEER FABRIC

Abstract of the Disclosure

A method of printing sheer fabric is described. In accordance with the method, a supply of the sheer fabric and a supply of a release substrate having a width less than the width of the sheer fabric are provided. A low tack adhesive is applied to an endless belt. The sheer fabric and the release substrate are combined such that the edges of the fabric overhang the edges of the release substrate and the overhanging edges of the sheer fabric and the release substrate are temporarily affixed to the endless belt with the low tack adhesive. The combined sheer fabric and release substrate are conveyed on the endless belt through one or more printing stations where at least one color ink is printed on the sheer fabric. The ink is dried and the sheer fabric is separated from the release substrate.
